

Early Journal Content on JSTOR, Free to Anyone in the World

This article is one of nearly 500,000 scholarly works digitized and made freely available to everyone in the world by JSTOR.

Known as the Early Journal Content, this set of works include research articles, news, letters, and other writings published in more than 200 of the oldest leading academic journals. The works date from the mid-seventeenth to the early twentieth centuries.

We encourage people to read and share the Early Journal Content openly and to tell others that this resource exists. People may post this content online or redistribute in any way for non-commercial purposes.

Read more about Early Journal Content at <http://about.jstor.org/participate-jstor/individuals/early-journal-content>.

JSTOR is a digital library of academic journals, books, and primary source objects. JSTOR helps people discover, use, and build upon a wide range of content through a powerful research and teaching platform, and preserves this content for future generations. JSTOR is part of ITHAKA, a not-for-profit organization that also includes Ithaka S+R and Portico. For more information about JSTOR, please contact support@jstor.org.

SOLUTIONS OF PROBLEMS.

ARITHMETIC.

122. Proposed by G. B. M. ZERR, A.M., Ph.D., Professor of Mathematics and Science, Chester High School, Chester, Pa.

Suppose 10% traction stock is 20% better in the market than 5% mining stock; if my income be \$500 from each, how much money have I paid for each, the whole investment bringing 6 $\frac{2}{3}$ %?

Solution by BENJAMIN F. YANNEY, A. M., Professor of Mathematics, Mount Union College, Alliance, Ohio; M. A. GRABER, Student in Heidelberg University, Tiffin, Ohio; E. L. SHERWOOD, Professor of Mathematics, Beaver College, Beaver, Pa.; and the PROPOSER.

$$\$500 \div .10 = \$5000 = \text{par value of traction stock};$$

$$\$500 \div .05 = \$10000 = \text{par value of mining stock};$$

$$\$1000 \div .06\frac{2}{3} = \$15000 = \text{whole investment.}$$

$\$5000 = \frac{1}{2}$ of \$10000 or the face of the traction stock is one-half the face of the mining stock = 50%.

$$\therefore 100\% = 50\% \text{ or } 1\% = \frac{1}{2}\%.$$

$20\% = 20 \times \frac{1}{2}\% = 10\% = \text{excess of traction stock over same amount of mining stock.}$

$$50\% + 10\% = 60\% = \text{investment in traction stock.}$$

$$100\% + 60\% = 160\% = \text{whole investment.}$$

$$\$15000 \div 1.60 = \$9375 = \text{amount invested in mining stock.}$$

$$\$15000 - \$9375 = \$5625 = \text{amount invested in traction stock.}$$

Also solved, with different results, by ELMER SCHUYLER, ALOIS F. KOVARIK, COOPER D. SCHMITT, and LESLIE L. LOCKE.

123. Proposed by F. P. MATZ, M. Sc., Ph. D., Professor of Mathematics and Astronomy, Irving College, Mechanicsburg, Pa.

If $m=2$ cents be the interest on $M=100$ cents for $p=40$ days, find the yearly rate per cent.

Solution by COOPER D. SCHMITT, A. M., Professor of Mathematics, University of Tennessee, Knoxville, Tenn.; ALOIS F. KOVARIK, Instructor in Mathematics and Science, Decorah Institute, Decorah, Iowa; LESLIE L. LOCKE, Professor of Mathematics, Fredonia Institute, Fredonia, Pa.; ELMER SCHUYLER, Professor of German, Reading, Pa.; and G. B. M. ZERR, A. M., Ph. D., Professor of Mathematics and Science, Chester High School, Chester, Pa.

If the interest on M cents for p days is m cents, the interest on M cents for 1 day is m/p cents, and for one year is $360m/p$ cents. Then the annual rate is $\frac{360m/p}{M}$ of 100% which equals $\frac{36000m}{pM}$. In the present example $m=2$, $p=40$, $M=100$. Whence rate $= \frac{2 \times 9000}{40 \times 100} = 18\%$.
